

Ramil Sususco

Infrastructure & Technical Operations Engineer

MSP Operations | Systems Administration | Migrations | Client Technical Support

Manila / NCR, Philippines (Remote) | hi@ramil.org | ramil.org

PROFESSIONAL SUMMARY

Infrastructure and technical operations engineer with more than 17 years in web platforms, hosting systems and technical support, including roughly nine years of remote Linux systems administration for international and US-based customers. Progressed from billing and frontline support into ownership of servers, virtualization, migrations, backups and incident investigation, working without a separate senior escalation engineer. Delivers large migrations without customer-visible downtime, fixes recurring faults permanently, and documents systems so they stay stable and supportable. Now extending these fundamentals into Microsoft 365, Entra ID and Azure administration through structured training and certification.

CORE COMPETENCIES

- Linux systems administration | Web hosting and MSP-style operations | Server and application migrations
- DNS, email deliverability, SSL and domain infrastructure | KVM virtualization | Backup and recovery operations
- Incident investigation and permanent remediation | Service monitoring | Maintenance and change coordination
- Client technical support across the full account lifecycle | Clear written explanation of technical findings
- Technical documentation and runbooks | API integrations and operational automation | Independent problem-solving

PROFESSIONAL EXPERIENCE

Squidix LLC - Infrastructure & Technical Operations

June 2017 to Present | Remote, supporting US-based hosting operations

- Progressed from billing and frontline support into responsibility for the hosting infrastructure, covering servers, virtualization, migrations, backups, monitoring and incident response, working self-directed without a separate senior escalation engineer.
- Operate and support Linux-based hosting infrastructure on cPanel/WHM, CloudLinux and CageFS, including the environment supporting more than 800 WordPress websites and their email, DNS and SSL services.
- Planned and executed a platform migration covering approximately 500 clients and 800 websites, sequencing the work in controlled batches, verifying results and coordinating client communication to limit disruption.
- Migrated approximately 30 virtual machines from Virtualizor to VirtFusion with no customer-visible downtime, and support a 64-core KVM virtualization environment covering provisioning, resource management and maintenance windows.
- Investigate incidents end to end across DNS, mail flow and deliverability, SSL and domain configuration, provisioning and server performance, applying permanent fixes rather than temporary workarounds. Mature systems, preventive maintenance and permanent remediation have cut recurring ticket volume well below the earlier baseline of about 20 tickets per day.
- Handle the complete customer lifecycle, including account provisioning, WHMCS billing integration, support resolution and asynchronous written communication with international and US-based customers, translating technical findings into clear actions.
- Standardize operations through runbooks, internal tooling, operational dashboards and automation, and maintain backup coverage and restores with JetBackup, mail routing with MailChannels, and service monitoring across the estate.

Seoul.fm - Founder & Technical Operator

2008 to Present | Remote

- Sole operator of a long-running production streaming platform, responsible for Linux servers, deployment, uptime, capacity and incident recovery.
- Manage DNS and Cloudflare configuration, TLS certificates, self-hosted monitoring and backups for a live service with an international audience.

Host Arabia LLC (Tasjeel.ae) - Hosting & Domain Operations Support

April 2024 to March 2025 | Remote, concurrent with Squidix LLC

- Supported hosting and domain operations, including account provisioning, domain and DNS administration, billing processes and direct customer support.
- Worked directly with customers on domain registration, DNS records, mail configuration and account questions, keeping written communication clear and responsive across time zones.

SELECTED INFRASTRUCTURE ACHIEVEMENTS

- Migrated approximately 500 clients and 800 websites to new infrastructure using controlled batching, verification and scheduled client communication.
- Moved approximately 30 virtual machines between Virtualizor and VirtFusion with no customer-visible downtime.
- Reduced recurring support volume from a baseline of roughly 20 tickets per day to a low steady state by eliminating repeat causes at the source.
- Operate backup and recovery processes with JetBackup, covering individual account restores through to full server recovery.
- Improved mail reliability and deliverability through DNS records, SPF, DKIM and DMARC alignment, and MailChannels routing.

RELEVANT TECHNICAL PROJECTS

- **MX Sentinel, email delivery observability.** Production monitoring across 25+ servers and approximately 150,000 messages per month, providing delivery health checks, incident visibility and operational reporting for mail infrastructure. Go, PostgreSQL, Docker, monitoring dashboards.
- **CallSentry, self-hosted AI voice receptionist.** Production service demonstrating API and telephony integration, call tracing, escalation handling, health monitoring and self-hosted deployment. Docker, PostgreSQL, REST APIs, webhooks.
- **Internal operations tooling and runbook library.** Internal dashboards, automation and documented procedures for provisioning, migration verification, backup checks and monitoring alerts, used to standardize routine operational work. Docker, GitHub, APIs, webhooks, PostgreSQL.

TECHNOLOGY SUMMARY

- **Platforms:** Linux (production), cPanel/WHM, WHMCS, CloudLinux, CageFS
- **Virtualization:** KVM (64-core environment), Virtualizor, VirtFusion, provisioning and resource management
- **Networking and security:** DNS, SSL/TLS, Cloudflare, VPNs, Tailscale, firewall fundamentals, network troubleshooting
- **Mail:** Email deliverability, MailChannels, SPF, DKIM, DMARC, mail flow investigation
- **Reliability:** JetBackup, backup and restore operations, service monitoring, alerting, incident investigation
- **Automation and integration:** Docker, GitHub, REST APIs, webhooks, PostgreSQL, self-hosted services, scripting, plus AI-assisted coding and research tools used to speed up investigation, documentation and automation, with all changes personally validated in production
- **In active development:** Windows Server, Active Directory, Microsoft Entra ID, Microsoft 365 tenant administration and migrations, Azure administration, endpoint management, MSP RMM and PSA platforms, studied through structured self-directed training with certification planned

AVAILABILITY & WORK SETUP

- Available full time during US Central business hours from a dedicated home office in Manila / NCR, Philippines.
- Two business-grade internet connections with static IP addresses, providing redundant connectivity.
- Roughly nine years of remote hosting and systems administration work with international and US-based customers, with strong written English and extensive asynchronous client communication.
